Rehabilitation

ABSTRACT

Presented are a statistical overview of the total handicapped population; detailed statistics on the blind, deaf and hard of hearing, mentally retarded, and mentally ill; and statistics on the Federal-State vocational rehabilitation program. Statistics are from 1970 to 1975 and are usually provided both for the nation as a whole, by state, for different age groups, by degree of handicapping severity, and per cent being served. Vocational rehabilitation data include numbers and percent served overall and by state. Also included is a section on handicapped youth including statistics on the per cent receiving special educational services. A concluding section provides definitions of visually impaired, hearing impaired, speech impaired, crippled or other health impaired, mentally retarded, emotionally disturbed, and learning disabled. Introduction

One of the first problems encountered in dealing with questions about the handicapped in this country is the question of numbers; that is, how many handicapped persons are there in the United States? Estimates, of course, vary on the answer to this question, but the problem is that these estimates are not located in any one, easily accessible place.

The purpose of this report is to gather together into one document some of the available recent statistical information on the handicapped in order to give a comprehensive picture of the subject.

The report includes first a statistical overview of the total handicapped population—in two different forms. This is followed by separate sections on four different disability groups for which detailed recent statistics are available—blind, deaf and hard-of-hearing, mental retardation, and mental illness. Finally there are statistics on the Federal-State vocational rehabilitation program and on handicapped youth.

Handicapped Population: Statistical Overview

The 1970 census yielded certain information in regard to the numbers of disabled persons in the 50 States and the District of Columbia. This data is limited to persons aged 16 to 64, noninstitutionalized and not in school. It was published in 1972 Senate hearings on legislation to amend the vocational rehabilitation act.

Numbers of disabled persons (1970)

16-64 non-institutionalized population not in school (universe)	104, 556, 000
Disabled persons	11,710,000
In labor force	5,597,000
Not in labor force	6, 114, 000
able to work	1,653,000
not able to work at all	4,461,000
not able to work, disabled 6 months or less	261,000
not able to work, disabled 6 months or more	4,200,000
Percent disabled persons of universe	11.20%
Percent of universe, disabled, and in labor force	5.35%
Percent of universe, disabled, and not in labor force	5.85%
Percent of universe, disabled, and able to work	1.58%
Percent of universe, disabled, and not able to work at all	4.27%

^{*}Population: Estimated total resident population, provisional, for each state from Current Population Reports, Series P-25, No. 508, November 1973, U.S. Bureau of the Census. The figures include persons in the Armed Forces stationed in each state, but exclude Armed Forces overseas. Figures for Puerto Rico and Virgin Islands are NSPB Statistics Department projections based on 1970 census data.

^{**}Estimated rate per 100,000 population (revised) for 1970 (NSPB Statistics Dept.) - Less than 50 persons.

Deaf and Hard-of-Hearing

The National Association of the Deaf in cooperation with the Deafness Research and Training Center, New York University, in 1974 completed several years of work on a survey of the deaf population of the United States. Their results were published in a book titled The Deaf Population of the United States, by Jerome D. Schein and Marcus T. Delk, Jr.

The following excerpt from the book defines the terms that are used in the statistical tables:

The figure for total hearing impairments—about 6.6 percent—includes all persons who responded in an interview that they had trouble hearing in one or both ears. Of this group, half reported difficulties in both ears. A little more than 13 percent of the hearing impaired group (0.87 percent of the population) indicated they could not hear and understand speech; i.e., were deaf.

When the deaf group is subdivided by age at onset, a little less than one fourth fall into the prevocational category (hearing ability lost before 19 years of age) and ll. 4 percent in the prelingual category (hearing ability lost before 3 years of age).

Prevalence and Prevalence Rates for Hearing Impairments

Mental Retardation

Ronald W. Conley, Ph.D., author of <u>The Economics of Mental Retardation</u>, has listed several characteristics of the population of mentally retarded persons in the United States. These characteristics were based on conclusions reached from a number of statewide and county surveys. Among the more important conclusions were:

- --Almost 3 percent of the population is mentally retarded.
- --Among children, the rate is a little above 3 percent and among adults, (because of high mortality) the rate is somewhat less.
- --Almost 12 percent of the retarded have IQs below 50, a percentage far in excess of that predicted by the normal curve. The majority of these are multiply handicapped.
- --Among whites, the prevalence is only 1.7 percent, but among nonwhites, it is over 12 percent.
- --Mental retardation is 4 times more likely to occur among lower social class children than among those of middle or upper social class.

[Ronald W. Conley, "Economics and Mental Retardation," Social and Rehabilitation Record, v. 1, November 1974, pp. 21 and 22.]

Comprehensive state-by-state figures on the total number of mentally retarded persons in the U.S. are not available, but the 1974 Statistical Abstract of the U.S. does include some data on mentally retarded persons in public institutions.

^{1/} No institutions for mentally retarded. Patients requiring hospitalization receive care at State mental hospital.

(1974 Statistical Abstract of the U.S., p. 84.)

Mental Illness

During hearings for the fiscal year 1975 appropriations for the Department of Health, Education, and Welfare, the chairman of the House Appropriations Subcommittee asked for a summary of the important statistics on mental illness. The Department supplied the following information to the Subcommittee:

Scope of the National Mental Health Problem

Introduction

Precision assessment of the national mental health problem is difficult if not impossible, since reliable statistics on the incidence and prevalence of mental disorders in the United States, or any other country, do not exist. One factor contributing to the situation is the absence of reliable diagnostic criteria for most mental disorders. The American Psychiatric Association now recognizes 148 such disorders, grouped into 10 major categories. In numerous cases, however, there is no uniformly accepted definition of the condition. This is true not only for the psychoneurosis, which afflicts more Americans than any other category of mental illness, but for the major psychoses—schizophrenia and depressive disorders—as well.

Gross Estimates

In spite of the obstacles noted above, figures have been assembled recently which, though not defining the dimensions of the problem with precision, are probably the best available estimates of the numbers of people directly affected. It is likely that in nearly every category the numbers cited are underestimates, since many troubled people never come to the attention of record-keeping agencies. The assembled estimates indicate that no less than 10 percent of the United States population—or 20 million people in 1971—suffer from some form of mental illness. About one—seventh of those afflicted actually receive psychiatric care of some sort.

Based upon those figures--and taking into account such factors as the mentally ill individual's loss of earnings and the cost of care both in and out of institutions--the estimated annual cost of mental illness in this country is about \$21 billion, or almost one quarter of the national defense budget.

This estimate may well be low; other estimates put the economic costs of alcoholism, alone, at \$15 billion annually, and the annual cost of drug abuse at \$10 billion. The data below indicate how the overall statistics are distributed among the major categories of mental health problems. In 1971 the admissions to all psychiatric inpatient and outpatient services were at the rate of 1,238.5 per 100,000 people. The admissions were composed of the following diagnostic categories:

Schizophrenia		258.0
Depressive disorders		216.9
Alcoholism		127.9
Organic brain syndromes		54. 9
Drug abuse	Cr. 1212	43.1
Mental retardation		28.9
Other psychotic disorders		18.9
Undiagnosed		88.9
All other diagnoses		401.1

For a better understanding of the scope of mental illness and behavior disorders, consider a hypothetical community of 150,000 citizens—about the middle of the range of the communities in which NIH-supported community mental health centers have been established. Assume that the hypothetical community directly reflects the characteristics of the population as a whole. Then the following will be true:

Of the 3,000 children born in the community annually, at least 600 will need some form of mental health service during their lifetime, and 240 will be treated in mental hospitals.

Each year, over 2,000 serious crimes will be committed, an average of 6 crimes a day. The crimes will include 8 murders, 17 forcible rapes, 160 assaults, 376 auto thefts, and 908 burglaries. Some undetected or unreported, and thus uncounted, crimes will be committed in each category. Community juvenile courts will see almost 1,000 youths per year between the ages of 10 and 17 years.

Almost 800 citizens will be admitted to inpatient psychiatric facilities every year.

Resident in the community at any given time will be 600 schizophrenics, tens of thousands of people suffering

from varying degrees of depression of different kinds, almost 4,000 alcoholics, 50 narcotic addicts, and 400 mentally ill children, almost one quarter of them in a mental hospital.

[Hearings before the Labor-HEW Subcommittee of the Committee on Appropriations, House of Representatives, 93rd Congress, 2nd Session, pp. 393-394.]

The 1974 Statistical Abstract does include some state-by-state data on patients in mental care facilities:

Handicapped Youth

The Rand Corporation in 1973 prepared a report for the Department of Health, Education, and Welfare on programs of services for handicapped youth, which contained several tables of statistics on the numbers of handicapped youth in the United States.

Estimated Number of Handicapped Youth Aged 0-21 in 1970

Type of Handicap	Number of Youth
Visual impairment Partially sighted Legally blind* Hearing impairment Deaf Hard of hearing Speech impairment Crippling or other health impairment Mental retardation Emotional disturbance Learning disability Multihandicapped	193,000 180,000 45,000 490,000 50,000 2,200,000 1,676,000 2,800,000 1,500,000 740,000 50,000
TOTAL	9, 550, 000

*Including 32,000 partially sighted.

Mentally retarded		-	1.54						
Auditorial impairment	0. 95		0.10		0.585				
Speech impairment	1.30		3.60		5 .000				
Visual impairment	0.06	0.057	0.05	0.054					
Emotionally disturbed			2.00						
Crippled			0.21						
Learning disabled			1.12						
Other health impairment			**						
Multihandicapped			0.07						
Total			8. 69						

^{*} Estimate sources are listed on page CRS-25.

^{**} Included with crippled.

- (a) R. P. Mackie, H. Williams, and P. P. Hunter, Statistics of Special Education for Exceptional Children and Youth, 1957-1958, USOE Bulletin No. OE-35048-58, 1963, as reported in R. A. Rossmiller, J. A. Hale and L. E. Frohreich, Educational Programs for Exceptional Children: Resource Configurations and Costs, National Educational Finance Project, Special Study No. 2, Department of Educational Administration, University of Wisconsin, Madison, Wisconsin, August 1970.
- (b) Estimated for age 5-19 youth in 1969. U.S. Department of Health, Education, and Welfare, Handicapped Children in the U.S. and Special Education Personnel Required-1968-1969 (est.), Bureau of Education for the Handicapped, August 1970.
- (c) Estimate developed from information contained in 1969-80 Summary of Special Education Services of Bureau for Special Education, Division for Handicapped Children, Wisconsin Department of Public Instruction, 1970 (mimeo) as reported in Rossmiller, op. cit., p. 122.
- (d) Estimates developed by the North Dakota State Department of Public Instruction as reported in <u>Description of Special Education Program 1972-1973</u>, submitted to the Bureau of Education for the Handicapped.
- (e) Estimates developed by the Nebraska State Department of Education as reported in Description of Special Education Program 1972-1973, submitted to the Bureau of Education for the Handicapped.
- (f) Actual number of children in Alabama identified as needing special education service through teacher referral divided by the number of children 5-17 according to the 1970 U.S. Census. The number of identified children is taken from Alabama Five-Year Plan Program for Exceptional Children and Youth, State Department of Education, Montgomery, Alabama, August 8, 1972. Note that the number reportedly identified is often higher than other estimates of the total handicapped youth in the population.
- (g) U.S. Department of Health, Education and Welfare, National Health Survey, Prevalence of Selected Impairments, July 1963-June 1965, Public Health Service, p. 9.
- (h) Kenneth Trouern-Trend, Blindness in the United States, Travelers Research Center, Hartford, Conn., 1968.
- (i) Rossmiller, op. cit., p. 121. This is the estimate used in the Rossmiller study after a review of other prevalence data.
- (j) Estimated Statistics on Blindness and Vision Problems, National Society for the Prevention of Blindness, Inc., New York, New York, 1966.
- (k) Derived from estimates in Human Communications and Its Disorders --An Overview. A report of the National Advisory Neurological Diseases and Stroke Council of the National Institute of Neurological Diseases and Stroke, National Institutes of Health, U.S. Department of Health, Education, and Welfare, Bethesda, Maryland, 1969.

[p. 276]

The Rand report also contained some statistics on the numbers and percentages of handicapped youth who were receiving special educational services.

[p. 115]

The Rand Corporation report includes additional materials and definitions of terms that are helpful in understanding the nature and scope of handicapping conditions among youth:

Visual Impairment

The usual definition of legal blindness is that a person's visual acuity for distant vision does not exceed 20/200 in the better eye, with best correction; or his visual acuity is more than 20/200 but the widest diameter of his field of vision subtends an angle no greater than 20. Within this category of legal blindness the quality of vision varies widely.

After considering many data sources, the National Society for the Prevention of Blindness indicates that the best data available suggest about 1 child in 4 of school age in the United States needs eye care; about 1 in 500 is partially sighted (i.e., uses sight as a chief channel of learning, including 42 percent of legally blind children and those with acuity after correction of better than 20/200 but less than 20/72); and about 1 in 2000 (0.054 in 100) is legally blind.

Using the NSPB prevalence estimates, and the fact that there were 83.8 million youth aged 0-21 in the United States in 1970, implies that in 1970 there were about 21 million youth who required eye care; 45,000 legally blind youth; and 168,000 partially sighted youth, of whom perhaps 20,000 were legally blind. If one defines partially sighted to include measurable acuity less than 20/70, with correction, then there are perhaps 180,000 partially sighted youth, of whom 32,000 are legally blind.

Degree of Vision: Ages 5-19

	Percent
Absolute blindness	16
Light perception	14
Light projection	1
Less than 5/200	8
5/200 but less than 10/200	6
10/200 but less than 20/200	12
20/200	26
Field restriction	1
Unknown	16

[p. 278]

Hearing Impairment

Hearing losses may be grouped into two broad categories: deafness, or sense of hearing that is nonfunctional for the ordinary purposes of life; and hard of hearing, or a sense of hearing that causes difficulty with such things as understanding speech, but which is at least partially functional.

[pp. 277-278]

The NINDS report estimates there were 236,000 deaf persons of all ages in the United States in 1970. Using their same data source, we note a prevalence of deafness in persons under age 15 of about 53 per 100,000 and 76 per 100,000 aged 15-24. Using these rates, we estimate the 1970 aged 0-21 deaf population is approximately 50,000. The NINDS report estimates that "about 8,500,000 Americans (in 1970) have auditory problems of one type or another which are less severe than deafness but which impair communication...about 4.5 percent (circa 360,000) are under 17 years." If we extrapolate at the same rate to the C-21 age range, the estimate is 440,000, or 0.525 percent of those in that age range.

Prevalence of Hearing Impairment, by Degree of Impairment

Degree of	Estimate									
Impairment	(a)	(b)	(c)	(d)	(e)	(f)	(g)	(i)	(j)	
Hard of hearing Deaf		0.500 0.075	0.08	2.0 0.1		0.200 0.003	0.95	0.1	0.525 0.060	

[p. 279] See page CRS-25 for sources (a) through (j).

Speech Impairment

Speech impairment includes absence of a larynx, stammering, stuttering, poor articulation, and other ill-defined troubles with speech. Since there is no precise definition of speech impairment, it would seem reasonable and there might be no reasonable consensus about the prevalence of this impairment. For a discussion of various prevalence data, see the NINDS report. In 1970 there were about 63 milion youth aged 5-21, which leads to an estimated 2,200,000 speech impaired youth if a 3.5-percent rate is used, or to an estimated 3,140,000 if a 5-percent rate is used.

[pp. 274-280]

Crippled and Other Health Impaired

Crippled and other health impaired include physical handicaps not characterized as speech, hearing, or visual handicaps. Crippled includes orthopedic or muscular impairments such as the absence, paralysis, or other impairment of the limbs, back or trunk. This category also includes children with chronic disease or other relatively long-term physical impairment such as problem involving the heart, blood, respiratory, or digestive systems.

[p. 280]

Mental Retardation

Mental retardation is a pervasive and quite common problem in all societies. Defining the terms that describe the disorder is at best a problematic undertaking and at worst an impossible one. Reacting to a variety of descriptors of mental retardation (e.g., age at onset, IQ, mental age, educability), an attempt by the American Association on Mental Deficiency to combine the concepts of functional proficiency and measured intelligence seems a reasonable enough place to begin.

Mental retardation refers to subaverage general intellectual functioning which originates in the developmental period and is associated with impairment in adaptive behavior.

Notwithstanding definitional (and other) problems, the 1970 White House Conference on Children, using estimates made by an earlier Presidential Committee, stated that in 1970 there were about 2.5 million mentally retarded children in the United States under the age of 20. Of these, some 75 percent were mildly retarded (educable), 15 percent were moderately retarded (trainable), 8 percent were severely retarded (many trainable), and 2 percent were profoundly retarded (unable to care for themselves). This estimate squares reasonably well with work done by Ronald W. Conley in his pioneering effort on measuring the economics of mental retardation programs. Conley considers a wide variety of data in estimates of mental retardation, disaggregated by age, which are 679,000 children aged 0-4, and 1,916,000 aged $\overline{5}$ -19, for a total of 2,595,000 aged 0-19. It is important to note that these estimates are for the total young retarded population, not those identified and receiving services, a considerably smaller figure....

The 1970 White House Conference also estimated that of the 100,000 to 200,000 babies born each year who are mentally retarded, one-fourth of their disorders are linked to genetic abnormalities, infections of the mother during early pregnancy, birth accidents, postnatal infections, or trauma. "In the remaining cases, inadequacies in prenatal and perinatal health care, nutrition, child rearing and social and environmental opportunities are suspected as causes of retardation."

[pp. 234-235]

Emotionally Disturbed

When psychiatrists agree upon what mental health is, and reliable instruments are developed to measure it, then it will be possible to obtain a consensus on the prevalence of emotional disturbance in youth. Current definitions leave a great deal to judgment about whether a child is emotionally disturbed or not. For example, emotionally disturbed children have been defined as those demonstrating one or more of the following characteristics:

- 1. An inability to earn which cannot be explained by intellectual, sensory or health factors.
- 2. An inability to build or maintain satisfactory interpersonal relationships with peers and teachers.
- 3. Inappropriate types of behavior or feelings under normal conditions.
- 4. A general, pervasive mood of unhappiness or depression.
- 5. A tendency to develop physical symptoms, pains or fears assocated with personal or school problems.

Just what is considered "inappropriate" behavior under "normal" conditions will vary by individual assessor. Since teachers are a principal source identifying handicaps and are usually not trained to identify the emotionally disturbed population, a large margin for error is introduced. A tendency may prevail to classify those who are difficult to handle in the classroom as emotionally disturbed. One would expect a relatively large variance in the estimates of the prevalence of emotionally disturbed youth. If one applies the BEH rate to the aged 3-21 population, one estimate would be about 1.5 million youth.

The second secon

[p. 281]

Learning Disabled

Learning disabled children have been defined as follows:

Children are said to have special learning disabilities when they have a disorder in one or more of the basic psychological processes involved in understanding or in using language, spoken or written, which may manifest itself in imperfect function in listening, speaking, writing, reading, spelling, or doing mathematical calculations. Such disorders include conditions described as perceptual handicaps, brain injury, minimal brain dysfunction, dyslexia, and developmental aphasia but do not include those with learning problems primarily the result of visual, hearing, or motor handicaps or mental retardation.
